

Configuration

With a basic knowledge of Qt, you could change the configuration of the default Kvantum theme. That configuration can be easily copied by using **Kvantum Manager** (click *Save* button on its third page) or, manually, by following these steps:

- (1) Create the folder “`~/.config/Kvantum/`” (~ is your home);
- (2) Create the file “`kvantum.kvconfig`” in the above folder with this line in it:

theme=***DefaultCopy***

Here, ***DefaultCopy*** could be any name you choose for the new configuration;

- (3) Create the folder “`~/.config/Kvantum/DefaultCopy/`” and the file “`DefaultCopy.kvconfig`” in it;
- (4) Copy/paste the contents of “`style/themeconfig/default.kvconfig`” (from the source) to the file “`DefaultCopy.kvconfig`”.

Now, you can change the values of variables (keys). Please note that deleting a variable often means that its value will be taken from the default configuration, so that you could keep only those sections or variables you want to change. See [below](#) for a more accurate explanation.

There are many sections (groups) and variables (keys) in the config file. That's intentional: unlike most theme engines, Kvantum is supposed to be able to control virtually all aspects of widgets. Here are the meanings of various sections:

Sections Table

Section (Group)	Meaning
[%General]	General info on the theme and some general variables.
[GeneralColors]	The most important colors used by the theme. Not necessary but good for independence from Qt color schemes outside KDE.
[Hacks]	Hacks for specific apps or widgets.
[PanelButtonCommand]	Panel for a button used to initiate an action, for example, a push button.

[PanelButtonTool]	Panel for a tool button.
[Dock]	A dock widget.
[DockTitle]	The title of a dock widget.
[IndicatorSpinBox]	Indicators of a spin widget.
[RadioButton]	A radio button.
[CheckBox]	A check box.
[Focus]	Generic focus indicator.
[GenericFrame]	Generic frame.
[LineEdit]	A line edit (one-line text editor).
[DropDownButton]	Indicator for a drop down button, for example, a tool button that displays a menu.
[ToolboxTab]	Just text colors for tab labels of a toolbox.
[Tab]	The tab shape within a tab bar. Also the tear indicator of a tab bar and the close button of a tab.
[TabFrame]	The frame for tab widgets.
[TabBarFrame]	The frame that is drawn for a tab bar, ususally for a tab bar that isn't part of a tab widget.
[TreeExpander]	Indicators used to represent the branch of a tree in a tree view.
[HeaderSection]	A header section. Also its label and arrow.
[SizeGrip]	Window resize handle if it exists.
[Toolbar]	A toolbar. Also its handle and separator.
[Scrollbar]	Scrollbar increase/decrease indicators (arrows).
[ScrollbarGroove]	The groove of a scrollbar.
[ScrollbarSlider]	A scrollbar slider.
[Slider]	A slider (a classic widget for controlling a bounded value).
[SliderCursor]	The handle of a slider.
[Progressbar]	The groove and label of a progressbar.
[ProgressbarContents]	The progress indicator.
[ItemView]	An item in an item view.
[Splitter]	A splitter handle.
[Menu]	The panel and frame of a menu. Also its frame shadow.
[MenuItem]	A menu item in a menu. Also the tear-off section of a menu.
[MenuBar]	The empty area of a menu bar.
[MenuBarItem]	A menu bar item, like the buttons in a menubar.
[TitleBar]	A title bar, like those used in QMdiSubWindow.

[ComboBox]	A combo box and its label.
[GroupBox]	A group box and the frame around it.
[ToolTip]	The panel for a tooltip label.
[StatusBar]	The frame of a status bar.
[Window]	A window or dialog.

The following table shows the variables (keys) you could change to configure the current theme – without necessarily making a new one. These are the rules for the value inheritance:

(1) If a section (group) is not present in your configuration, its variables and their values will be taken from the default config file.

(2) If a variable is not present in a section of your configuration:

(2a) First the “*inherits*” section will be searched for it and then, If nothing is found,

(2b) its value will be taken from the same section of the default config file.

There are three exceptions to these rules:

Exception No.1: The “*inherits*” variable will not be taken from the default config file if it is not present in a section.

Exception No.2: If colors are omitted or not valid or if a section they could belong to is not present, they will be taken from the currently used color scheme. Also font boldness/italicity will be ignored if omitted.

Exception No.3: Any variable related to compositing or hacking will be ignored if omitted.

Variables Table

Variable (Key)	Value	Meaning
<i>The General Section</i>		
author	string	Obvious.
comment	string	Obvious.
x11drag	true/false	Drag windows from anywhere possible?
alt_mnemonic	true/false	Show underlines only when Alt is pressed?
left_tabs	true/false	Align tabs to the left edge? Tabs are centered by default.
joined_tabs	true/false	Join tabs together? They are detached by default.

attach_active_tab	true/false	Attach the active tab to the tab widget? It is detached by default.
group_toolbar_buttons	true/false	Raise and group neighbor toolbar buttons? By default, they are not raised.
center_toolbar_handle	true/false	If true, the SVG element for the toolbar handle will be centered and its size will be that of the toolbar indicator. Otherwise, it will be scaled vertically with an 8-px width. False by default.
toolbutton_style	integer	Sets the toolbutton style when it is not set by the app. 0: follow, 1: icon only, 2: text only, 3: text beside icon, and 4: text under icon. The toolbutton style is 0 by default.
spread_progressbar	true/false	Spread progressbar's indicator across its whole groove and not just its interior? By default, the indicator is drawn inside progressbar's frame.
textless_progressbar	true/false	No percentage label for progress bars? They have percentage labels by default.
menubar_mouse_tracking	true/false	Enable mouse tracking in menubars? It is enabled by default.
composite	true/false	Use compositing to have translucent menus or tooltips? It is automatically set to false if no compositing is available. Its absence also means false.
menu_shadow_depth	integer	The depth of the shadow menus cast. A value of zero, its absence or a false value for <i>composite</i> means no shadow.
tooltip_shadow_depth	integer	The depth of the shadow tooltips cast. A value of zero, its absence or a false value for <i>composite</i> means no shadow.
translucent_windows	true/false	Translucent windows and dialogs? This requires a translucent SVG element too. A false value, its absence or a false value for <i>composite</i> means no translucency.
opaque	String list	A comma-separated list of executables, whose apps should not have window translucency. It has meaning only if <i>translucent_windows</i> is set to true.
blurring	true/false	Blur the screen area behind translucent windows in KDE? This needs KDE blur effect and also a graphic card that supports it. It has no effect when <i>composite</i> or <i>translucent_windows</i> is false.

splitter_width	integer	The width of splitter handles.
scroll_width	integer	The width of scrollbars. The default value is 12px.
slider_width	integer	The width of sliders. The default value is 8px.
slider_handle_width slider_handle_length	integer	The width or height of slider handles. The default values are 16px.
check_size	integer	The width and height of checkboxes and radio buttons. The default value is 13px.

The GeneralColors Section

window.color	String (#RRGGBB)	A general background color as #RRGGBB or with a valid name like white, black, red, etc.
base.color	String (#RRGGBB)	Used mostly as the background color for text entry widgets.
alt.base.color	String (#RRGGBB)	Used as the alternate background color in views with alternating row colors.
button.color	String (#RRGGBB)	The general button background color.
light.color	String (#RRGGBB)	Lighter than <i>button.color</i> (used mostly for 3D bevels).
mid.light.color	String (#RRGGBB)	Between <i>button.color</i> and <i>light.color</i> (used mostly for 3D bevels).
dark.color	String (#RRGGBB)	Darker than <i>button.color</i> (used mostly for 3D bevels).
mid.color	String (#RRGGBB)	Between <i>button.color</i> and <i>dark.color</i> (used mostly for 3D bevels).
shadow.color	String (#RRGGBB)	A very dark color. By default, it is black. (used mostly for 3D bevels).
highlight.color	String (#RRGGBB)	A color for text selection.
inactive.highlight.color	String (#RRGGBB)	Like <i>highlight.color</i> but when the text widget does not have focus.
text.color	String (#RRGGBB)	The foreground color used with <i>base.color</i> .
window.text.color	String (#RRGGBB)	A general foreground color.
button.text.color	String (#RRGGBB)	Obvious.

disabled.text.color	String (#RRGGBB)	Obvious.
tooltip.text.color	String (#RRGGBB)	Obvious.
highlight.text.color	String (#RRGGBB)	The color of selected text.
link.color	String (#RRGGBB)	Obvious.
link.visited.color	String (#RRGGBB)	Obvious.

The Hacks Section

transparent_dolphin_view	true/false	No background or frame for Dolphin's view (Dolphin is the file manager of KDE)?
blur_konsole	true/false	Blur the region behind Konsole's transparent background if possible?
transparent_ktitle_label	true/false	No background for the label of KtitleWidget (a KDE widget with a heading label)?
respect_darkness	true/false	Some apps don't respect dark themes. Fix that as far as possible?

Other Sections

inherits	string	The name of a section (in the same config file and without brackets) whose configuration is also used for this one.
frame	true/false	Draw a frame around the widget?
frame.top frame.bottom frame.left frame.right	integer	The height or width of the corresponding frame part.
frame.repeat.top.patternsize frame.repeat.bottom.patternsize frame.repeat.left.patternsize frame.repeat.right.patternsize	integer	The frame pattern sizes if a pattern is used for drawing the frame.
interior	true/false	Draw an interior for the widget?
interior.repeat.x.patternsize interior.repeat.y.patternsize	integer	The interior pattern sizes.
indicator.size	integer	Some widgets, like scrollbar arrows, have indicators. This is their size.
text.margin	true/false	Put a margin around the text?

text.margin.top text.margin.bottom text.margin.left text.margin.right	integer	The sizes of the text margins if there is any.
text.normal.color	String (#RRGGBB)	The color of the normal text as #RRGGBB or with a valid name like white, black, red, etc. It may override the text colors defined under the GeneralColors section.
text.focus.color	String (#RRGGBB)	The color of the focused (hover) text.
text.press.color	String (#RRGGBB)	The color of the pressed text.
text.toggle.color	String (#RRGGBB)	The color of the toggled text.
text.bold	true/false	Bold font for text? The font is not bold by default.
text.italic	true/false	Italic font for text? The font is not italic by default.
text.shadow	true/false	Draw a shadow for the text?
text.shadow.xshift text.shadow.yshift	integer	The vertical/horizontal shifts of the text shadow if it exists.
text.shadow.color	string (#RRGGBB)	The color of the text shadow as #RRGGBB or with a valid name like white, black, red, etc.
text.shadow.alpha	integer (0-255)	The opacity of the text shadow. 255 means completely opaque.
text.shadow.depth	integer	The text shadow depth.
size.minwidth size.minheight	integer	Minimum/fixed width or height of a menu/menuitem, for example.

If you want to make your own theme (see the file "Theme-Making"), you'll also need to know the meanings of these variables:

Elements Table

Variable (Key)	Value	Meaning
interior.element	string	The SVG element to be used for drawing the interior of a widget.
frame.element	string	The SVG element to be used for drawing the frame of a widget.
indicator.element	string	The SVG element to be used for drawing the indicator of a widget.

Some Examples

If you don't want menus and tooltips to be translucent or cast shadow and want the color scheme to be used for all texts, you could use a blank configuration or a very basic one with just this in it:

```
[%General]
```

You could also be more explicit:

```
[%General]  
composite=false
```

```
[PanelButtonCommand]  
text.normal.color=none  
text.focus.color=none  
text.press.color=none  
text.toggle.color=none
```

Here “none” is not a valid color, so text colors will be taken from the currently used color scheme.

If you want to have bigger buttons without increasing your font sizes, you could use this:

```
[%General]  
composite=true  
menu_shadow_depth=6  
tooltip_shadow_depth=6
```

```
[PanelButtonCommand]  
text.normal.color=white  
text.focus.color=#80C0FF  
text.press.color=white  
text.toggle.color=white  
text.margin.top=4  
text.margin.bottom=4  
text.margin.left=5  
text.margin.right=5
```

```
[PanelButtonTool]  
inherits=PanelButtonCommand
```

To have black text shadows with light green focused text, use this (black text shadows are already defined but disabled in the default config file):

```
[%General]  
composite=true  
menu_shadow_depth=6  
tooltip_shadow_depth=6
```

```
[PanelButtonCommand]  
text.normal.color=white  
text.focus.color=lightgreen  
text.press.color=white  
text.toggle.color=white  
text.shadow=true
```

Note that, in the two examples above, the compositing values and normal/focused/pressed text colors are also added because otherwise, they would be disabled ([see the exceptions above](#)). In the previous example, customized text colors were disabled for all widgets other than push-buttons because there were no sections for them. If you want them back, you could add sections like these:

```
[PanelButtonTool]  
inherits=PanelButtonCommand
```

```
[Tab]  
inherits=PanelButtonCommand
```

```
[MenuItem]  
inherits=PanelButtonCommand
```

And so on.
